## Background

This gene encodes a protein that belongs to the inositol phosphokinase (IPK) family. This protein is likely responsible for the conversion of inositol hexakisphosphate (InsP<sub>6</sub>) to diphosphoinositol pentakisphosphate (InsP<sub>7</sub>/PP-InsP<sub>5</sub>). It may also convert 1,3,4,5,6-pentakisphosphate (InsP<sub>5</sub>) to PP-InsP<sub>4</sub>. Alternative splicing results in multiple transcript variants encoding the same protein. IP6K3 (Inositol Hexakisphosphate Kinase 3) is a Protein Coding gene. Among its related pathways are Farnesoid X Receptor Pathway and Inositol phosphate metabolism (REACTOME). GO annotations related to this gene include inositol-1,4,5-trisphosphate 3-kinase activity and inositol hexakisphosphate 1-kinase activity. An important paralog of this gene is IP6K1.
