Background

GMPT, also known as GMPT1, belongs to the IMPDH/GMPT family. This family of enzymes includes IMP dehydrogenase and GMP reductase. These enzymes are involved in purine metabolism and adopt a TIM barrel structure. GMPT is an enzyme that catalyzes the irreversible and NADPH-dependent reductive deamination of GMP to IMP. GMPT functions in the conversion of nucleobase, nucleoside and nucleotide derivatives of G to A nucleotides, and in maintaining the intracellular balance of A and G nucleotides.
