Background

SerpinB11 (serpin peptidase inhibitor , clade B (ovalbumin) , member 11) , also known as EPIPIN or SERPIN11 , is a 392 amino acid cytoplasmic protein that belongs to the Ov-serpin subfamily and serpin family. Like other members of the serpin family , SerpinB11 has been identified as a noninhibitory intracellular protein. The gene encoding SerpinB11 maps to human chromosome 18 , which houses over 300 protein-coding genes and contains nearly 76 million bases. There are a variety of diseases associated with defects in chromosome 18-localized genes , some of which include Trisomy 18 (also known as Edwards syndrome) , Niemann-Pick disease , hereditary hemorrhagic telangiectasia , erythropoietic protoporphyria and follicular lymphomas.
