### Background

CD132 is a 64-70 kD type I transmembrane glycoprotein of the Ig superfamily, and is also known as common  $\gamma$  chain ( $\gamma_c$ ) or IL-2 receptor  $\gamma$  subunit. It is expressed broadly on T- and B-lymphocytes, NK cells, monocytes, and granulocytes. CD132 is an essential component of cytokine receptors for IL-2, IL-4, IL-7, IL-9, IL-15, and IL-21. Ligand binding induces tyrosine phosphorylation and initiates signaling through a JAK/STAT pathway. CD132 mutation results in X-linked severe combined immune deficiency (XSCID).
