Background

This gene belongs to a group of vacuolar protein sorting (VPS) genes.The encoded protein is a component of a large multimeric complex, termed the retromer complex, involved in retrograde transport of proteins from endosomes to the trans-Golgi network.The close structural similarity between the yeast and human proteins that make up this complex suggests a similarity in function.Expression studies in yeast and mammalian cells indicate that this protein interacts directly with VPS35, which serves as the core of the retromer complex.
