Conjugation Information Elab Fluor[®] 647 is designed to be excited by the Red laser (627-640 nm) and detected

using an optical filter centered near 670 nm (e.g., a 660/20 nm bandpass filter).

Applications Recommended usage

FCM

Each lot of this antibody is quality control tested by flow cytometric analysis. The amount of the reagent is suggested to be used 5 μ L of antibody per test (million cells in 100 μ L staining volume or per 100 μ L of whole blood). Please check your vial before the experiment. Since applications vary, the appropriate dilutions must be determined for individual use.

Data

C57BL/6 murine splenocytes are stained with Elab Fluor[®] 647 Anti-Mouse CD8a Antibody (filled gray histogram).
Unstained splenocytes (empty black histogram) are used as

control.

Background

CD8, also known as Lyt-2, Ly-2, or T8, consists of disulfide-linked α and β chains that form the α (CD8a)/ β (CD8b) heterodimer and α / α homodimer. CD8a is a 34 kD protein that belongs to the immunoglobulin family. The CD8 α / β heterodimer is expressed on the surface of most thymocytes and a subset of mature TCR α / β T cells. CD8 expression on mature T cells is non-overlapping with CD4. The CD8 α / α homodimer is expressed on a subset of γ / δ TCR-bearing T cells, NK cells, intestinal intraepithelial lymphocytes, and lymphoid dendritic cells. CD8 is an antigen co-receptor on T cells that interacts with MHC class I on antigen-presenting cells or epithelial cells. CD8 promotes T cell activation through its association with the TCR complex and protein tyrosine kinase lck.
