Data

Flow cytometric analysis of Human B2M / Beta-2-microglobulin expression on human whole blood lymphocytes. Cells were stained with purified anti-Human B2M / Beta-2-microglobulin, then a PE-conjugated second step antibody. The fluorescence histograms were derived from gated events with the forward and side light-scatter characteristics of viable lymphocytes.

Immunohistochemistry of paraffin-embedded human ovarian cancer using Beta-2 microglobulin/B2M Monoclonal Antibody at dilution of 1:60.

Immunofluorescence analysis of B2M in HeLa cells. Cells were fixed with 4% PFA, permeabilized with 0.1% Triton X-100 in PBS, blocked with 10% serum, and incubated with mouse anti-human B2M Monoclonal Antibody (dilution ratio 1:60) at 4°C overnight. Then cells were stained with the

Alexa Fluor®488-conjugated Goat Anti-mouse IgG secondary antibody (green) and counterstained with DAPI for nuclear staining (blue). Positive staining was localized to Cytoplasm and cell membrane.

Immunohistochemistry of paraffin-embedded human skin using Beta-2 microglobulin/B2M Monoclonal Antibody at dilution of 1:60.

Background

This gene encodes a serum protein found in association with the major histocompatibility complex (MHC) class I heavy chain on the surface of nearly all nucleated cells. The protein has a predominantly beta-pleated sheet structure that can form amyloid fibrils in some pathological conditions. The encoded antimicrobial protein displays antibacterial activity in amniotic fluid. A mutation in this gene has been shown to result in hypercatabolic hypoproteinemia.
