## Background

This gene encodes a member of the transient receptor potential (TRP) protein family, which is a diverse group of proteins with structural features typical of ion channels. This protein plays an important role in taste transduction, and has characteristics of a calcium-activated, non-selective cation channel that carries Na<sup>+</sup>, K<sup>+</sup>, and Cs<sup>+</sup> ions equally well, but not Ca(2<sup>+</sup>) ions. It is activated by lower concentrations of intracellular Ca(2<sup>+</sup>), and inhibited by higher concentrations. It

is also a highly temperature-sensitive, heat activated channel showing a steep increase of inward currents at temperatures between 15 and 35 degrees Celsius. This gene is located within the Beckwith-Wiedemann syndrome critical region-1 on chromosome 11p15.5, and has been shown to be imprinted, with exclusive expression from the paternal allele.
