Background

GMPr; also known as GMPr1; belongs to the IMPDH/GMPr family. This family of enzymes includes IMP dehydrogenase and GMP reductase. These enzymes are involved in purine metabolism and adopt a TIM barrel structure. GMPr is an enzyme that catalyzes the irreversible and NADPH-dependent reductive deamination of GMP to IMP. GMPr functions in the conversion of nucleobase; nucleoside and nucleotide derivatives of G to A nucleotides; and in maintaining the intracellular balance of A and G nucleotides.
