Background	
<p>lipopolysaccharide-binding protein (IBP),a 58kDa glycoprotein synthesized in hepatocytes,belongs to a family of lipid-binding proteins that includes bactericidal/permeability increasing protein (BPI),phospholipid ester transfer protein ( PLTP),and cholesterol ester transfer protein (CETP). IBP binds to the lipidA portion of lipopolysaccharide (IPS) to facilitate the process of IPS monomerization,catalyzes the binding of IPS monomers to CD14,and promotes IPS-induced immune response.</p>
