Background

The protein encoded by this gene is thought to be a transcriptional corepressor.However, molecules that interact with this protein have not yet been identified.The protein is a member of the tripartite motif family.This motif includes three zinc-binding domains, a RING, a B-box type 1 and a B-box type 2, and a coiled-coil region.Three alternatively spliced transcript variants for this gene have been described, however, the full-length nature of one variant has not been determined.
