Background

Isoform 1 or the secreted form is a binding and antagonizing protein for members of the TGF-beta family , such as activin , BMP2 and MSTN. Inhibits activin A- , activin B- , BMP2- and MSDT-induced cellular signaling , more effective on activin A than on activin B. Involved in bone formation , inhibits osteoclast differentiation. Involved in hematopoiesis , involved in differentiation of hemopoietic progenitor cells , increases hematopoietic cell adhesion to fibronectin and seems to contribute to the adhesion of hematopoietic precursor cells to the bone marrow stroma. Isoform 2 or the nuclear form is probably involved in transcriptional regulation via interaction with MLLT10.
